## **Editorial Review**

### Review

This compilation of collaboratively authored chapters gathers the dispersed literature on combustion and related areas. It focuses on chemical, petroleum, and power generation industries. By offering chapters on fundamentals (turbulent flow, heat transfer, chemical kinetics, and more) and equipment design/application (coverage including burners, heaters, flares, and thermal oxidizers), this work makes the important link between theory and application in industry. Timely topics covered include computational fluid dynamics, pollution emission, and design of experiments. ...a great value for the in-depth coverage of this sometimes overlooked subject. Recommended.
